

IT 113-Information Assurance and Security 2

Assignment #2

Name: Nardo, Christian C.
Program: BSIT-4

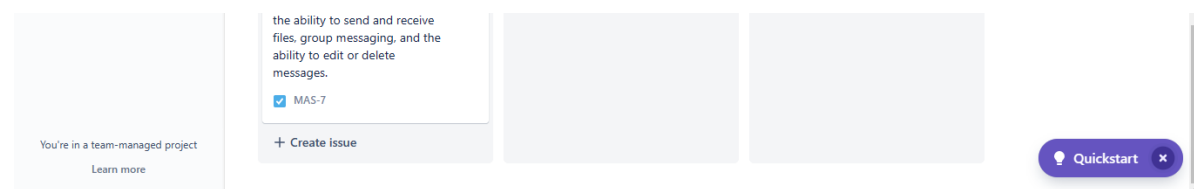

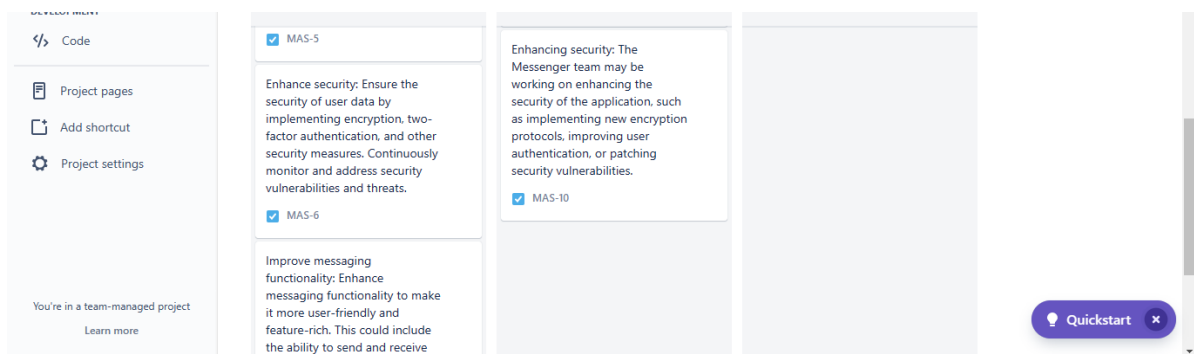

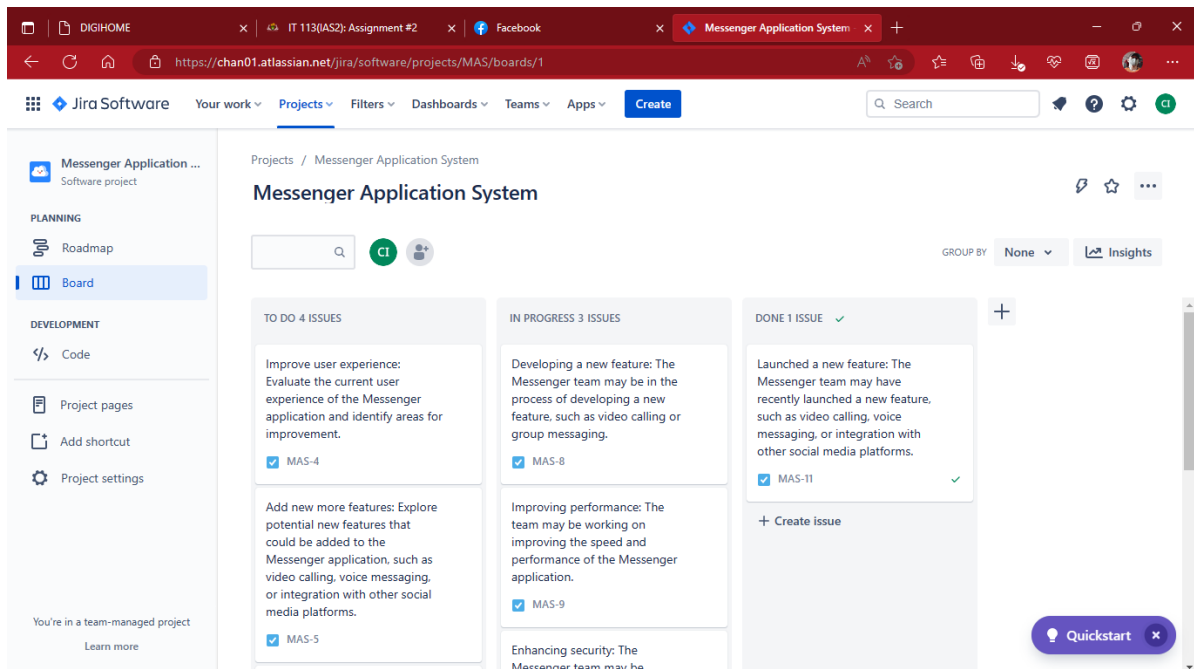

Section: OQR1

Instruction: Answer the following and do the Design tracking (50pts). Screenshot your Design Progress Tracking and paste here the Trello Link of your work:

SCREENSHOT:

1. Referring to the system you selected for Labs 1 and 2. Determine the forward and reverse influences on contextual factors.

User behavior: The way users interact with the messenger application system can have a significant impact on its contextual factors. For example, if users frequently send messages with certain keywords or phrases, the system may start to use that information to suggest responses or provide more personalized experiences. This is a forward influence, as user behavior is driving changes in the system's contextual factors. On the other hand, the messenger application system can also influence user behavior. For example, if the system starts to provide more relevant suggestions or content based on user actions, users may be more likely to engage with the system in a certain way. This is a reverse influence, as the system is driving changes in user behavior.

2. Explain how these systems reflect or influence the organizational structure.

Messenger application systems can provide new channels of communication between employees, departments, and teams. These channels can be used to facilitate collaboration, share information, and coordinate tasks. The way these channels are set up and used can reflect the organizational structure. For example, if different departments or teams use different channels or have different levels of access to certain channels, it can reflect the hierarchical structure of the organization. On the other hand, the way these channels are used can also influence the organizational structure. If employees are encouraged to communicate more frequently and openly across departments or teams, it could lead to a flatter organizational structure where collaboration and innovation are prioritized over strict hierarchies.

3. Then, whether your work is a system or not, keep track of the design progress. Track the development of your designs with the use of TRELLO and the KANBAN template.
